CRITICAL PROBLEMS

0

BROKEN LINKS & IMAGES

Your homepage links to 13 pages and your sitemap lists 138 pages. We audited your 25 most prominent pages: the homepage, the pages your navigation links to first, then the shallowest pages in your sitemap. Each page got 18 checks, your domain got 14 more, and your top 5 pages were speed-tested by Google.

Your fix plan

The 10 changes that matter most, ranked by how serious each problem is and how many pages it affects.

- Email Deliverability** ● Critical · Whole site
Without SPF, DKIM and DMARC your emails land in spam and others can send mail as your domain.
How to fix: Publish SPF, DKIM and DMARC records in your domain's DNS.
- Images without alt text** ● Warning · 25 pages
Alt text is how Google Images and screen readers understand a picture. Without it the image is invisible to both.
How to fix: Add a short description of each image in its alt attribute; use alt="" only for purely decorative images.
- Pages sharing the same title** ● Warning · 7 pages
When several pages share one title, Google can't tell which to show and they compete with each other.
How to fix: Give every page its own title that says what is different about that page.
- Pages sharing the same meta description** ● Warning · 7 pages
Identical descriptions make different pages look the same in search results, so fewer people click the right one.
How to fix: Write a description for each page that is specific to what that page offers.
- Accessibility problems** ● Warning · 4 pages
People using screen readers or keyboards can't use these parts of the page, and Google rewards pages everyone can use.
How to fix: Label every form field, give every link and button readable text, add alt text and keep heading levels in order.
- Slow or heavy pages** ● Warning · 3 pages
Pages that answer slowly or ship heavy HTML lose visitors before they load, especially on phones.
How to fix: Cache pages at the server or a CDN, and trim the HTML: inline scripts and styles, oversized markup and embedded data.

- 7

Pages that are mostly code

● Notice · 25 pages

When visible text is a small share of the page's code, the page is heavy and its content may look thin.
How to fix: Move inline scripts and styles into files, remove unused markup, and add useful text where it's missing.
- 8

Thin pages (under 300 words)

● Warning · 2 pages

Pages with very little text rarely rank: there isn't enough there for Google to understand or trust.
How to fix: Add genuinely useful content to pages you want found (answers, details, examples), or merge thin pages into stronger ones.
- 9

Meta descriptions too short or too long

● Notice · 9 pages

Google cuts descriptions after about 160 characters, and short ones leave out the reason to click.
How to fix: Aim for 140-160 characters.
- 10

Pages missing social sharing tags

● Notice · 9 pages

Without Open Graph tags, links shared on Facebook, LinkedIn, WhatsApp and Slack show no image or a random one.
How to fix: Add og:title, og:description, og:image and og:url to every page.

Pages without structured data

● Notice · 5 pages

WHY IT MATTERS

Structured data (schema.org) earns rich results such as stars, FAQs and breadcrumbs, and helps AI search understand the page.

HOW TO FIX

Add JSON-LD that fits each page: Organization on the homepage, Article on posts, Product or Service on offer pages, FAQPage where you answer questions.

PAGE
/about
/contact
/privacy
/terms
/disclaimer

Pages below Google's speed bar (Core Web Vitals)

● Notice · 3 pages

WHY IT MATTERS

Core Web Vitals are part of how Google ranks pages, and they measure how fast and stable the page feels.

HOW TO FIX

Shrink and lazy-load images, defer non-critical JavaScript, and reserve space for images and embeds so the layout doesn't jump.

PAGE	SCORE	LCP	CLS	TBT
/	59	8.3 s	0	580 ms
/blog/social-media-character-limits	78	2.9 s	0	640 ms
/blog/social-media-image-sizes	86	2.1 s	0	460 ms

Mobile lab test from Google PageSpeed Insights.

Speed on your top pages

PAGE	SCORE	LCP	CLS	TBT	REAL-USER LCP
/	59	8.3 s	0	580 ms	Not enough data
/tools	90	2.4 s	0	290 ms	Not enough data
/blog	93	2.6 s	0	170 ms	Not enough data
/blog/social-media-character-limits	78	2.9 s	0	640 ms	Not enough data
/blog/social-media-image-sizes	86	2.1 s	0	460 ms	Not enough data

Mobile lab test from Google PageSpeed Insights. Good: LCP under 2.5 s, CLS under 0.1, TBT under 200 ms. Real-user LCP comes from Chrome users of your site, where Google has enough of them.

Security Headers

● Good · Score 88 · 2 issues

WHY IT MATTERS

Missing security headers leave visitors more exposed to attacks like clickjacking.

HOW TO FIX

Add Strict-Transport-Security, Content-Security-Policy, X-Content-Type-Options and Referrer-Policy.

Security headers

HEADER	STATUS	CURRENT VALUE	WHAT IT DOES
Strict-Transport-Security	OK	max-age=63072000; includeSubDomains; preload	Browsers will refuse plain HTTP for 730 days, including subdomains, and the site is eligi...

SORBS	Not listed
CBL (Abuseat)	Not listed

Email Deliverability

● Poor · Score 10 · 3 issues

WHY IT MATTERS

Without SPF, DKIM and DMARC your emails land in spam and others can send mail as your domain.

HOW TO FIX

Publish SPF, DKIM and DMARC records in your domain's DNS.

Mail servers (MX) inbound-smtp.ap-northeast-1.amazonaws.com
SPF record Missing
DMARC record Missing
DKIM Not found in 11 common selectors

- No SPF record found — anyone can send email that appears to be from this domain, with nothing telling receiving servers which servers are actually authorized.
- No DMARC record found — without one, receiving mail servers have no domain-set policy for what to do with mail that fails SPF/DKIM checks, and the domain owner gets no visibility into spoofing attempts.
- No DKIM record found among 11 common selector names — this domain may still have DKIM configured under a custom selector this check can't guess.
